

# OUR SIGNATURE EECP® METHOD

## EFFECT ON QUALITY OF LIFE

EECP® has been shown to improve the Quality Of Life in client. Quality of life is measured by the ability to resume daily living, social interaction and recreational activities. The squeezing mechanism of EECP increases the release of endorphins into the body.

- Many clinical studies demonstrate long-term improvement in quality of life with EECP. In a study conducted in 2005 by Dr. O. Soran, 58 percent of patients studied improved quality of life post-EECP treatments. After a two-year follow-up, 63 percent of people improved their quality of life compared with the baseline
- Other studies show that among people who undergo EECP treatment, 70 percent to 80 percent of them realize immediate benefit
- Clients tell us that they have experienced improvement in exercise duration and sleep. Also due to the endorphins that are released during EECP clients report having a happier, more hopeful and optimistic outlook
