

# OUR SIGNATURE EECP® METHOD

## EFFECT ON RENAL FAILURE

EECP has been shown to improve the Renal Failure. Renal Failure is a condition in which the kidneys are functioning less than normal. When the kidney are not working well, waste and toxins build up in the body. The squeezing mechanism of EECP helps detox and filter the blood to remove waste from the kidneys.

- Increases sheer stress of reversed blood flow and positively influences renal function by increasing oxygenated blood to the kidneys
- Aids in kidney regeneration improving levels of harmful toxins while also stimulating the production of adequate urine volume
- Helps Clients improve their kidney function even after just one session of EECP
- We have seen people who have been able to ward off dialysis or get off of dialysis and lower BUN and creatinine levels
